Conectar un Linked Service con Azure Data Lake Storage utilizando seguridad

Empezaremos creando un Linked Service

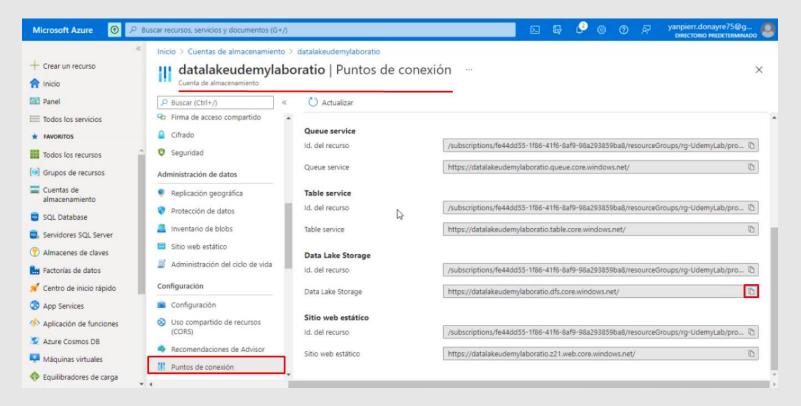

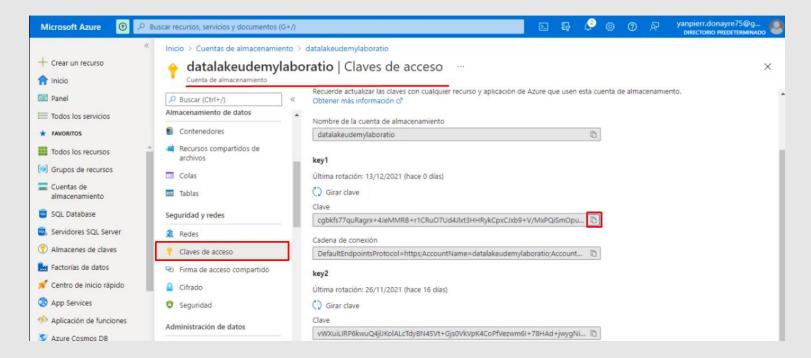

Utilizar Access Keys

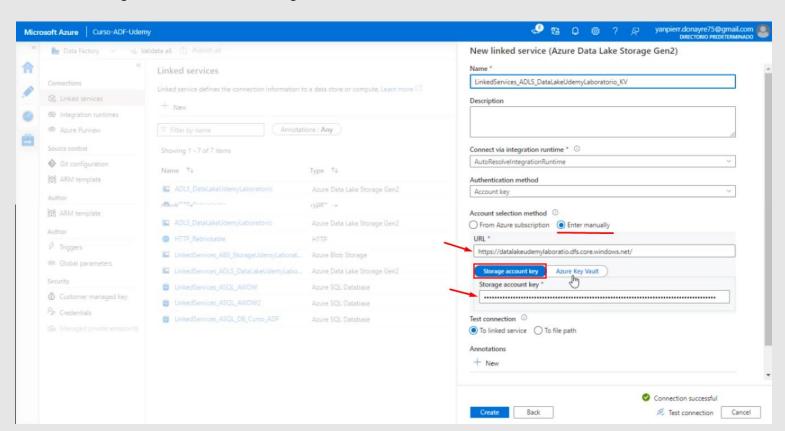

Antes, desde otra pestaña, desde la Storage account vamos a copiar desde 'Endpoints' la **URL** de nuestra cuenta de almacenamiento

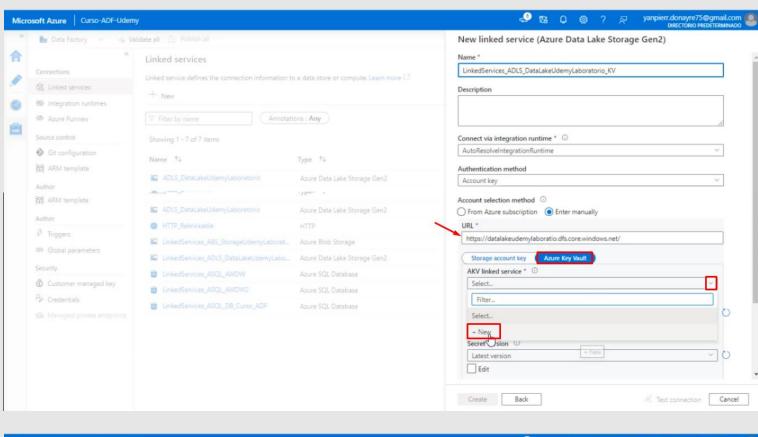

Y también vamos a copiar desde 'Access Keys' una clave, una Storage account key

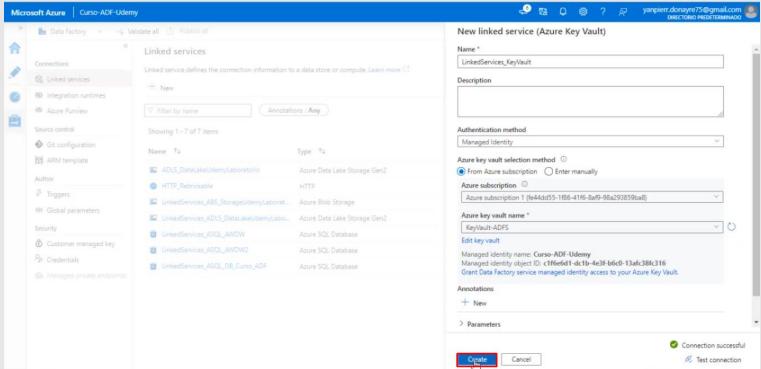

Luego, continuamos con la configuración de nuestro Linked Service

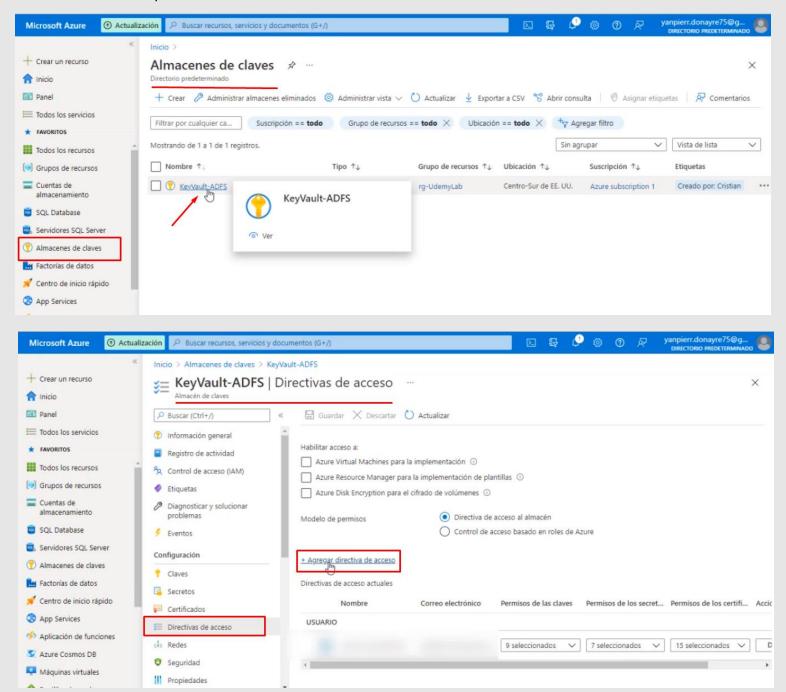

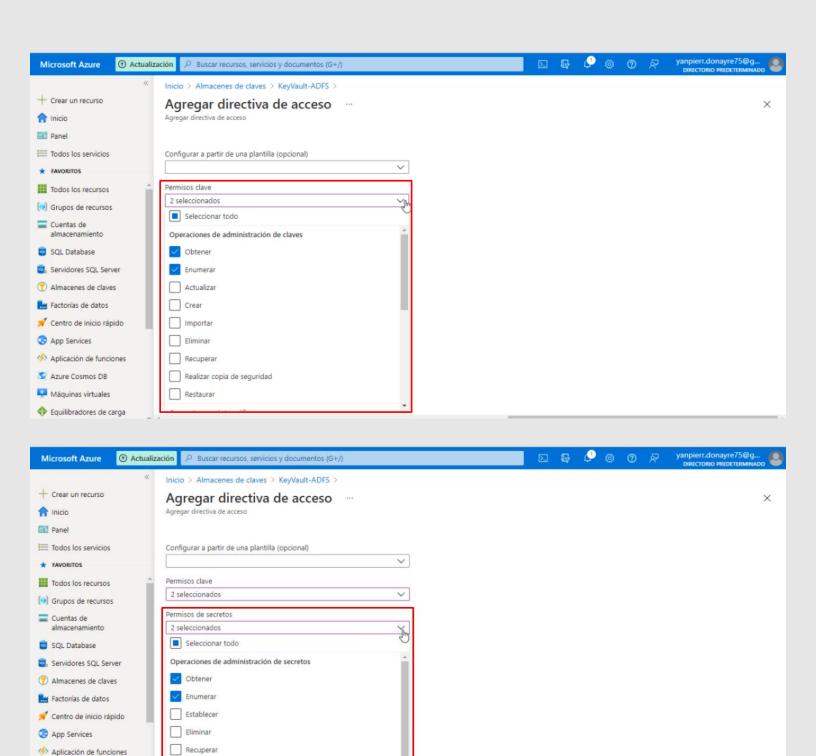

Utilizar Azure Key Vault (Secreto)

Antes de continuar con la configuración de nuestro Linked Service, vamos a dirigirnos al recurso de Azure Key Vault

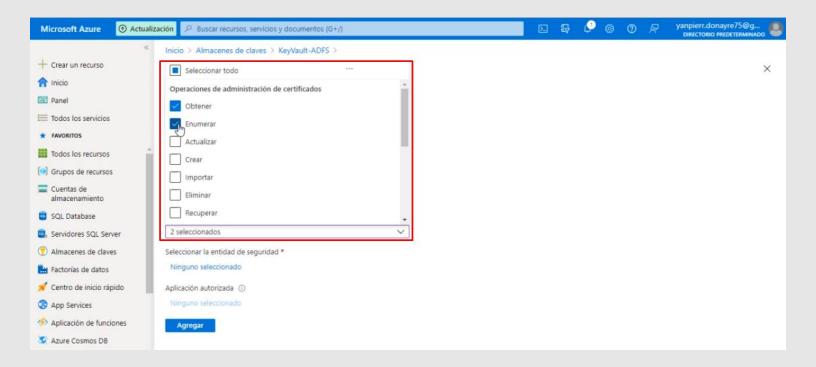

Azure Cosmos DB

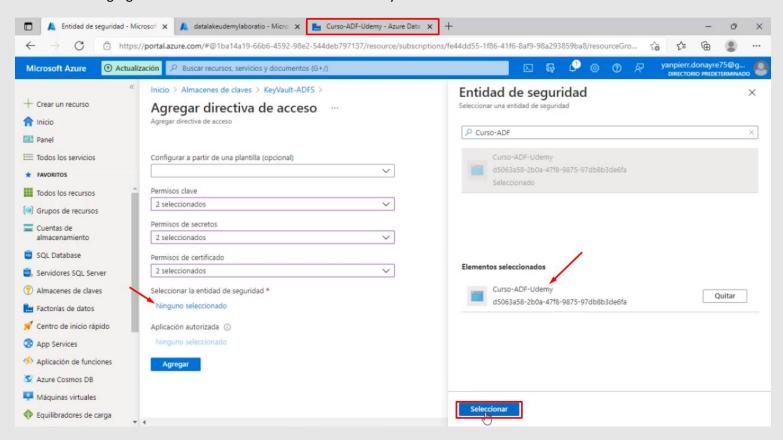

Máquinas virtuales

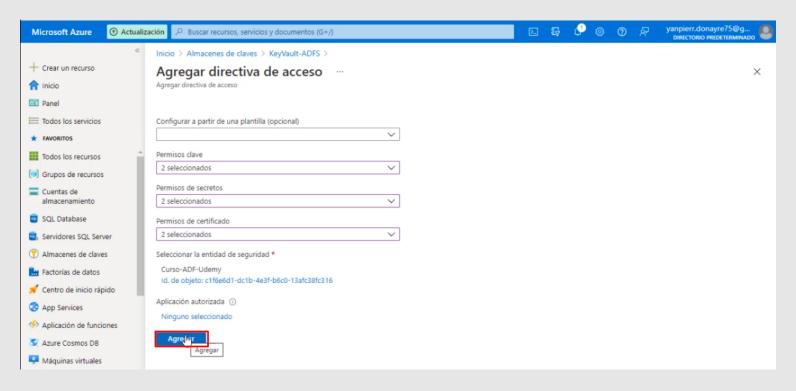

Equilibradores de carga

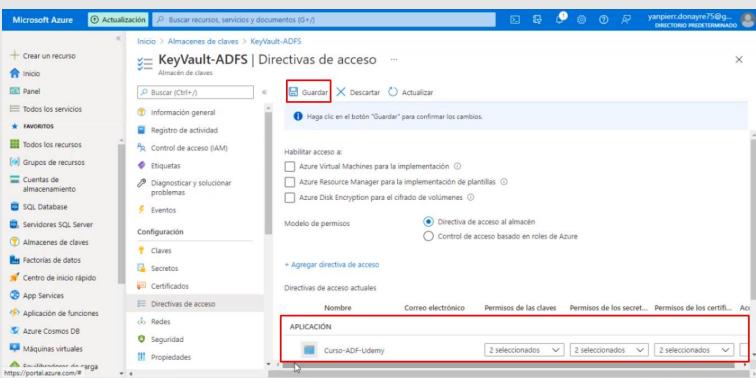

Copia de seguridad
Restaurar

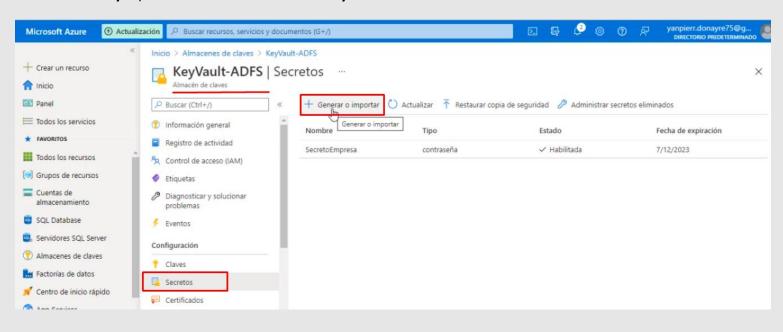

Agregamos nuestro recurso de Azure Data Factory

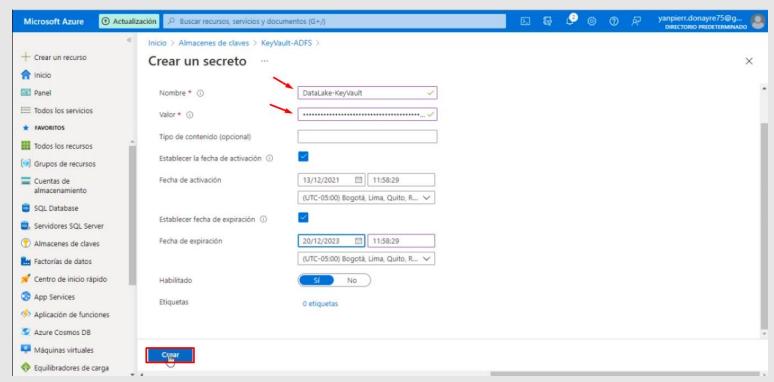

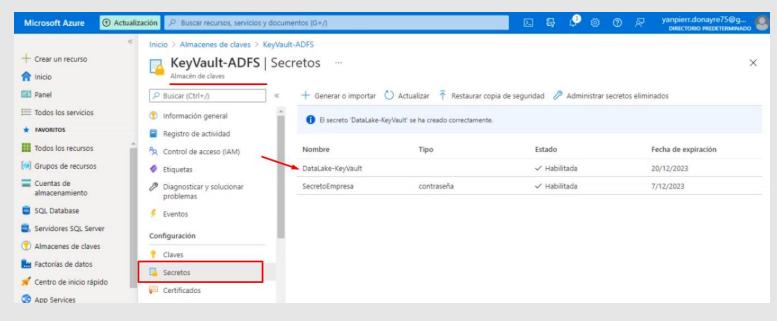

Siguiendo en Azure Key Vault, ahora vamos a generar un Secreto. En "Valor" debemos pegar nuestra **Key1** que obtenemos desde "**Access Keys** o **Claves de acceso**"
